

DEPI – Software Testing Track

Part 01: Java Fundamentals

Instructor: Mina Younan

Session 11 – Task GP

(A) Create a Java-based student management system that allows administrators to manage student information, grades, and attendance.

- Create classes for students, courses, instructors, and grades.
- Implement inheritance and polymorphism where appropriate (e.g., different types of students or instructors).
- Use encapsulation to protect data and control access.
- Create methods for student management (Add, edit, and delete student records) also for course management.
- Create methods to record and calculate grades for students.

Hint: Prepare relevant project documentation.

You are **not required to submit the documentation** for this task; however, you should use this opportunity to **practice writing a formal project report** that clearly explains the project, its requirements, design, implementation, and results.
